### III. Short Answer Type

38.  $\text{HNO}_3$  acts as a base in the nitrating mixture and provides the electrophile,  $\text{NO}_2^+$ .
39. See NCERT textbook for Class XII.
40.  $\text{C}_6\text{H}_5\text{CH}_2\text{OH}$
41. Reduction of nitriles with sodium/alcohol or  $\text{LiAlH}_4$  gives primary amine.
42. 
43. Benzene sulphonylchloride.
44. Benzene diazonium chloride is very unstable.
45. See NCERT textbook for Class XII.
46. Nitrogen is less electronegative than oxygen therefore lone pair of electrons on nitrogen is readily available for donation. Hence,  $\text{MeNH}_2$  is more basic than  $\text{MeOH}$ .
47. Pyridine and other bases are used to remove the side product i.e.  $\text{HCl}$  from the reaction mixture.
48. Reaction is done in mild basic conditions.
49. A mixture of 2-bromoaniline and 4-bromoaniline is formed.

(2-Bromoaniline)

(4-Bromoaniline)

50.  $\text{CH}_3\text{CH}_2\text{CH}_3 < \text{CH}_3\text{CH}_2\text{NH}_2 < \text{CH}_3\text{CH}_2\text{OH}$
51.  $\text{CH}_2=\text{CH}-\text{CH}_2-\text{NH}_2$ , prop-2-en-1-amine
52. N, N-Dimethylbenzenamine
53. Z is an aliphatic amine which gives a solid insoluble in base. This implies that reaction with  $\text{C}_6\text{H}_5\text{SO}_2\text{Cl}$  must give a product without any replaceable hydrogen attached to nitrogen. In other words, the amine must be a secondary amine. i.e. Z is ethylmethylamine.

Carbylamine reaction is shown by  $1^\circ$  amine only which results in the replacement of two hydrogen atoms attached to nitrogen atom of  $\text{NH}_2$  group by one carbon atom. On catalytic reduction the isocyanide will give a secondary amine with one methyl group.

55. The reaction exhibits azo-coupling of phenols. In mild alkaline conditions phenol moiety participates in the azo-coupling and para position of phenol is occupied.

56. Aniline forms the salt anilinium chloride which is water soluble.

60.

61. This reaction is an example of electrophilic aromatic substitution. In alkaline medium, phenol generates phenoxide ion which is more electron rich than phenol and hence more reactive for electrophilic attack. The electrophile in this reaction is aryldiazonium cation. Stronger the electrophile faster is the reaction. *p*-Nitrophenyldiazonium cation is a stronger electrophile than *p*-toluene diazonium cation. Therefore, it couples preferentially with phenol.
